Which doc, when?

Quick map to help you navigate this repo. There are several files. Each one is the right doc for a different moment.

At a glance

Document	What it does
README.md	Top-level pitch, status, build path, content layout
WHICH_DOC_WHEN.md	This file. Routes you to the right doc for the moment you’re in.
BRIEF.md	Project brief — purpose, audience, scope, tech stack, decisions log
FORK.md	Eight-step recipe for repurposing this template for your own topic
CONTENT-SPEC.md	The frontmatter contract every .md file in /content/ must satisfy
SITE-CONFIG.md	Field-by-field reference for site.config.json
IMAGES.md	Image manifest + Nano Banana prompts for the lesson illustrations
GLOSSARY.md	Plain-language definitions for every technical term used in the docs
AGENTS.md	Rules for AI coding agents working in this repo
DESIGN.md	Design system (deliberate before-state until Module 3 swaps it via Stitch)
DEMO.md	Pointer to the build path
dist/module_NN_*/README.md	One per module — what to do, prompts to paste, Defend-It questions
content/lessons/**/*.*md	The 16 lessons the site renders
content/build-diary/*.*md	Five entries explaining how the site was made

Document	What it does
site.config.json	Site-wide metadata (title, navigation order, branding, feature flags)

The pair that matters most

During each module, two surfaces work in tandem:

- **The module README** at `dist/module_NN_*/README.md` — what to do, prompts to paste, what to check
- **The crash course** — the narrative explanation of *why* each step works, with deeper coverage per module

The crash course is **delivered separately by your instructor** (it's not in this repo). You should have it open in a second window or printed alongside while you work through each module. A student who only opens the module README is following a recipe. A student who reads both is learning the craft.

If you don't have the crash course yet, ask your instructor.

What each doc is for, organised by reading-moment

Before you start anything: - README.md — what this repo is, who it's for, what you'll build - WHICH_DOC_WHEN.md (this file) — the map - BRIEF.md §1–§3 — the project context

While you're building: - `dist/module_NN_*/README.md` — the step-by-step for the current module - The crash course (separately delivered) — the narrative companion - GLOSSARY.md — when you hit a term you don't recognise

When you want to fork the template for a new subject: - FORK.md — the eight-step recipe - SITE-CONFIG.md — what every field in `site.config.json` does - CONTENT-SPEC.md — the frontmatter contract for your new content - IMAGES.md — how to manage images for your fork

Reference (read on demand): - AGENTS.md — what the IDE agent assumes about this repo - DESIGN.md — the design tokens currently applied - `content/build-diary/*.md` — deep-dive essays on each architectural choice

“I don't know which doc to open right now”

A short decision tree:

- **Setting up your dev environment for the first time** → the crash course § Set up your dev environment (most thorough), or `dist/module_01_planning_files/README.md` § setup (shorter pointer)
- **Running a module** → that module's README in `/dist/`
- **The agent did something unexpected during a prompt** → the matching build-diary entry (`content/build-diary/02-scaffolding-with-antigravity.md` for Module 2, etc.)
- **Hit a Stitch / MCP / Vercel error** → the crash course § Troubleshooting (organised by surface area)
- **What does this term mean?** → GLOSSARY.md
- **How do I change the site title / accent colour / navigation?** → SITE-CONFIG.md
- **Forking for your own subject** → FORK.md first, then SITE-CONFIG.md and CONTENT-SPEC.md

When in doubt

Ask the agent in Antigravity. AGENTS.md makes it aware of all the docs in this repo. A prompt like “given the rules in AGENTS.md, what doc should I read for X?” will point you at the right file.
